Advancing a robust portfolio *focused on muscle diseases*

We are building a leading muscle disease company dedicated to advancing innovative, life-transforming therapies for genetically driven diseases. Our initial focus is on Duchenne muscular dystrophy (DMD), myotonic dystrophy type 1 (DM1) and facioscapulo-humeral muscular dystrophy (FSHD). Each of these disorders has a profound impact on affected communities around the world.

Our Pipeline

*ACHIEVE Trial: ClinicalTrials.gov. NCT05481879. https://clinicaltrials.gov/ct2/show/NCT05481879.
**DELIVER Trial: ClinicalTrials.gov. NCT05524883. https://clinicaltrials.gov/ct2/show/NCT05524883. Clinicaltrialsregister.eu. 2021-005478-24.

Our Programs

Duchenne Muscular Dystrophy (DMD)

OVERVIEW

- Mutation in the *DMD* gene that encodes for dystrophin
- Onset in first few years of life
- Life expectancy ~30 years

CLINICAL PRESENTATION

- Muscle weakness
- Progressive loss of function
- Loss of ambulation
- Respiratory/cardiac failure

POPULATION

- ~12,000 - 15,000 (US)
- ~25,000 (Europe)

Our DMD program candidates:

DYNE-251 is our candidate being developed for people living with DMD who are amenable to exon 51 skipping. DYNE-251 consists of a phosphorodiamidate morpholino oligomer (PMO) conjugated to a proprietary Fab. It is designed to enable targeted muscle tissue delivery and promote exon skipping in the nucleus, allowing muscle cells to create a truncated, functional dystrophin protein, with the goal of stopping or reversing disease progression. In preclinical studies with the FORCE™ platform, robust and durable exon skipping and dystrophin expression were observed in the *mdx* mouse model in skeletal and cardiac muscles, as well as reduced muscle damage and increased muscle function. DYNE-251 demonstrated a favorable safety profile and achieved impressive exon skipping in non-human primates, especially in the heart and diaphragm, muscles that weaken over time leading to mortality in people living with DMD.

We plan to expand our DMD franchise and develop therapies for patients with mutations amenable to skipping other exons, including exons 53, 45 and 44.

Myotonic Dystrophy Type 1 (DM1)

OVERVIEW

- Mutation in the *DMPK* gene
- Onset at any point, depending on DM1 phenotype
- Life expectancy of 45-60 years

CLINICAL PRESENTATION

- Myotonia
- Muscle weakness
- Cardiac arrhythmia
- Pulmonary abnormalities

POPULATION

- >40,000 (US)
- >74,000 (Europe)

Our DM1 program candidate:

Our DM1 candidate, DYNE-101, consists of a proprietary Fab conjugated with our linker to an antisense oligonucleotide (ASO). Our DM1 program is designed to address the genetic basis of DM1 by reducing the levels of mutant *DMPK* RNA in the nucleus, releasing splicing proteins, allowing normal mRNA processing and translation of normal proteins and potentially stopping or reversing disease. In preclinical studies, we have observed reduction of nuclear foci and correction of splicing in DM1 patient cells, robust reduction in toxic human nuclear *DMPK* RNA and correction of splicing in a novel *in vivo* model developed by Dyne, reversal of myotonia after a single dose in a DM1 disease model, and enhanced muscle distribution as evidenced by reduced levels of cytoplasmic wild-type *DMPK* RNA in non-human primates.

Facioscapulohumeral Muscular Dystrophy (FSHD)

OVERVIEW

- Aberrant expression of *DUX4*
- Onset in teen years or young adulthood
- Normal life expectancy

CLINICAL PRESENTATION

- Progressive wasting and skeletal muscle loss
- Significant physical limitations

POPULATION

- ~16,000 - 38,000 (US)
- ~35,000 (Europe)

Our FSHD program candidate:

FSHD is caused by an aberrant expression of the *DUX4* gene in muscle tissue, which leads to death of muscle and replacement by fat. Our FSHD candidate, DYNE-301, consists of our proprietary Fab conjugated with our linker to an ASO that is designed to address the genetic basis of FSHD by reducing *DUX4* expression in muscle tissue. We have an agreement with the University of Mons that provides us with exclusive access to intellectual property to target the genetic cause of FSHD and complements our own proprietary platform for precision delivery into muscle cells. We generated proof-of-concept data showing that DYNE-301 reduced expression of key *DUX4* biomarkers in FSHD patient myotubes.
